

Energy Efficiency Management

Your questions:

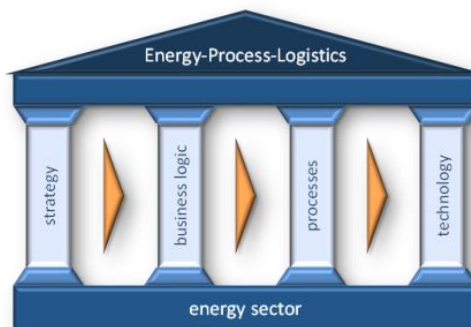

- What are your top energy consumers in the company?
- What are your potentials to design the production process more efficient?
- How can your company achieve a transparent energy balance?
- Do you have a sustainable procurement strategy for your energy purchase?

Our solution: Energy Efficiency Management

Information:

Dr. Hollmann & Kammel Management Consultants possess many years of experience in the liberalized energy market and have developed **Energy-Process-Logistics (EPL)** which is an integral methodology to evolve and to implement sustainable concepts.

Energie Effizienz Management (EEM) is the key future topic for all value-adding companies. Energy, energy use and the knowledge about the energy quantity that are used for the value creation of the products are integral parts for an efficient value creation. Energy efficiency requires a high transparency of the production logistics about the used commodities such as electricity, gas, heat, lubricants and other.

Energy monitoring along the entire value added chain generates the needed transparency to position the company sustainable and holistically energy-efficient.

An overall energy balance is an essential precondition to achieve an optimized procurement strategy.
